

## IMPORT TEMPLATES

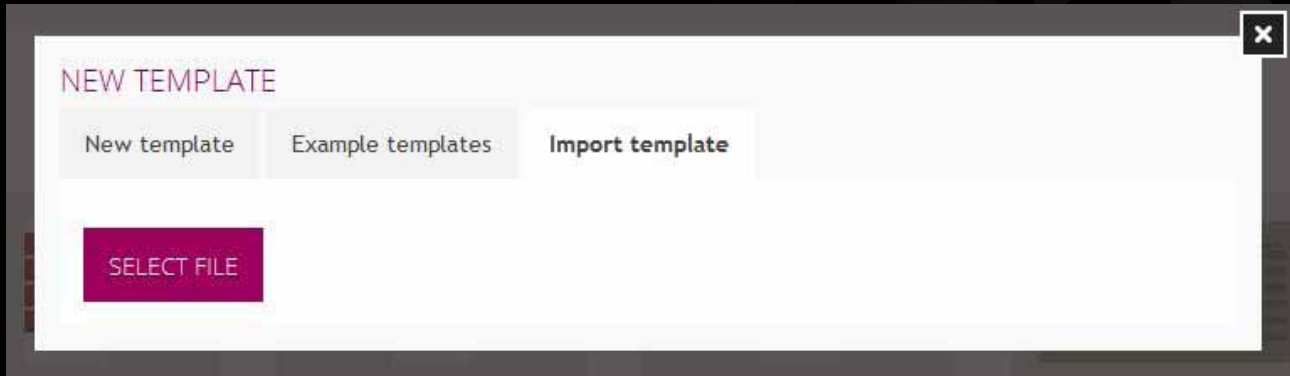

Importing templates and masterpages is done in the Templates section in the designer. When you have downloaded a demo template from the website follow these steps to get the template in your account.

### Extract the file

You have downloaded the .zip file from the website to your own computer, for example *bar.zip*. Right click the file and choose *Unpack all*. Once unpacked there will be new zip-files, these files don't need to be unpacked! Among these files there is one *MP-xxxx.zip* file, this is the *Masterpage*, the other files are *Templates*. These are the files you need for importing into the designer.

### Import files into the designer

Login into your TDM-designer-account, go to *Content > Templates* and choose *New template*. Go to the *Import template* tab, the following popup will appear:

Click on the button *Select file* and choose one of the .zip files, when clicked on open the file will be imported into the designer. When a file is a Masterpage, the TDM designer will automatically recognize this. Masterpages will be imported within the Masterpage section and Templates in the Template section.

When all files are imported you can start editing the masterpage or template to your own demands.
